

Measuring the value of managed health care

Praneet Valodia

Methods to measure value

- Health outcomes
- Benchmarking
- Return on investment
- Trend analysis (using moving average)
- Claims cost versus inflation over time (year to year)
- Other: Total population approach, survival analysis

Use combination of methods

Definition: Health Outcomes

A **scientific** discipline that evaluates the effect of **health care interventions** on patient-related, if not **patient specific**, economic, clinical and humanistic outcomes

ISPOR BOOK OF TERMS

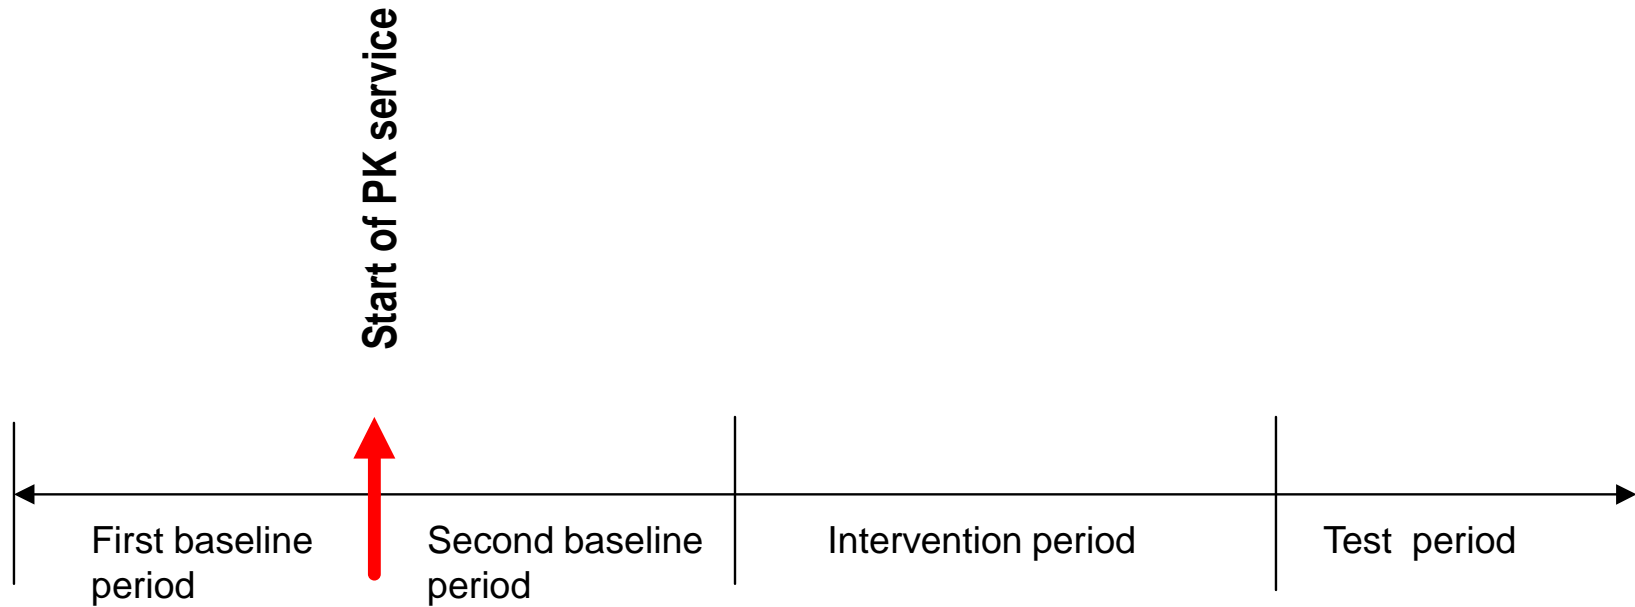

Health Outcomes Assessment

Difference = Outcome

Value of managed health care

Pre-Post intervention: phenytoin

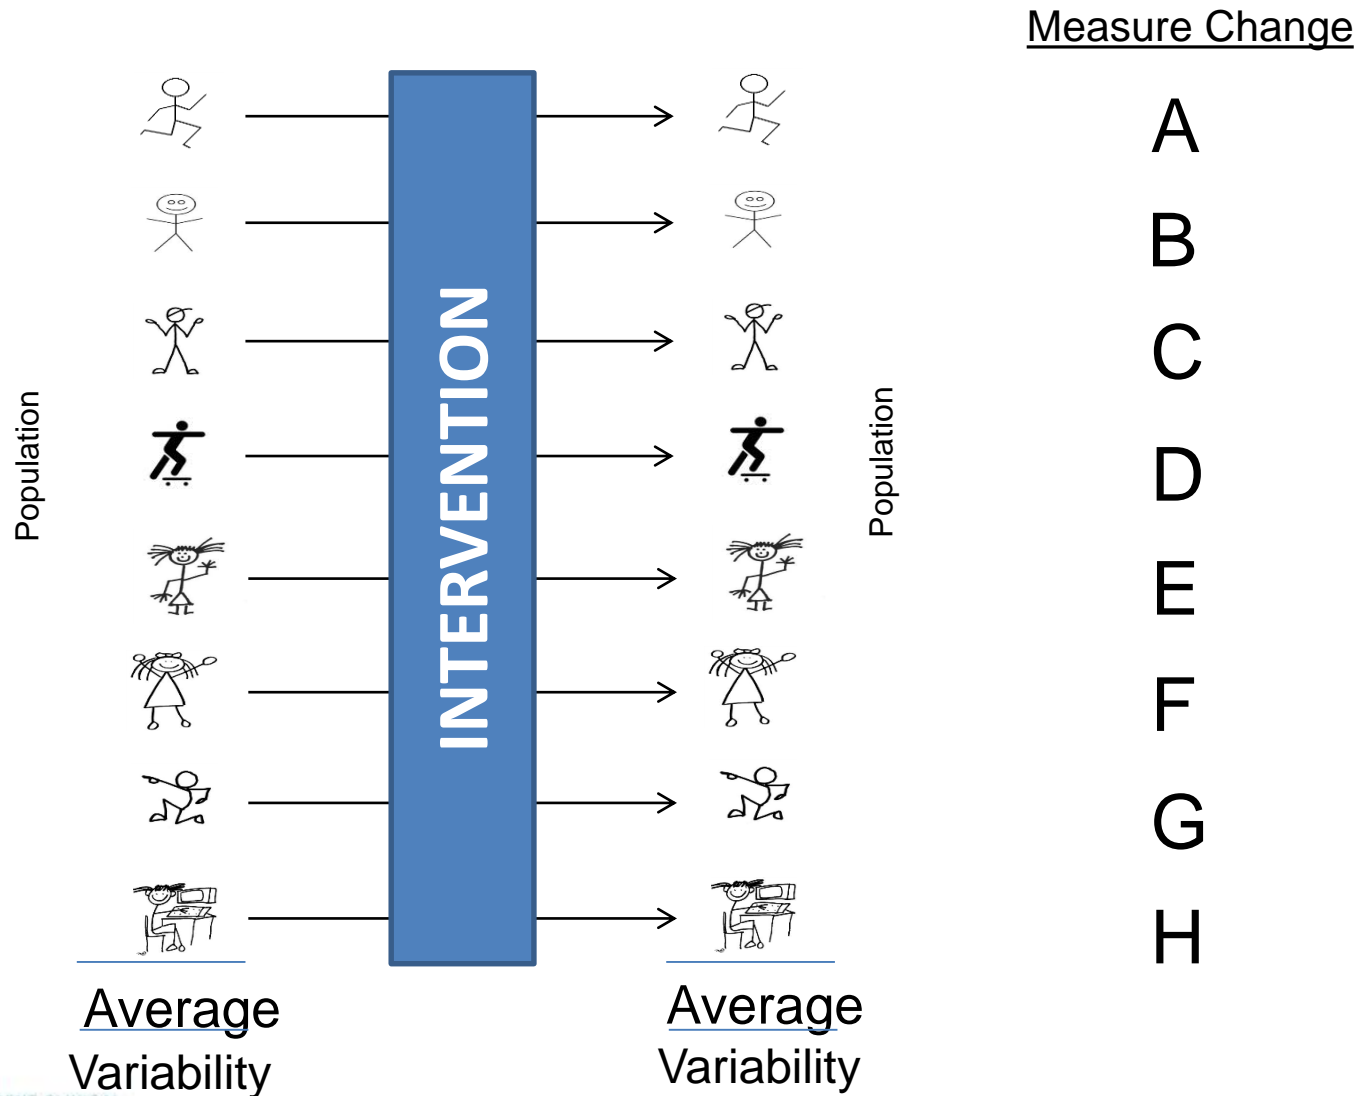

P. Valodia et al, Benefits of a clinical pharmacokinetic service in optimizing phenytoin use in the Western Cape. SAMJ.1998,88:873-875

PRE- AND POST INTERVENTION

Population vs Individual Health Outcomes Assessment

Asthma: Health Outcomes

Clinical

- Categorization of uncontrolled, partially control and controlled patients
- Frequency of symptoms
- Severity of symptoms
- Number of symptoms
- Number of asthma attacks
- Number of emergency room visits.
- Number of asthma related hospital days
- Number of nebulisations
- Number GP consults
- Number specialists consults
- Asthma related admissions

Economic

- Savings due to reduced hospitalizations
- Savings due to reduced emergency room visits
- Savings due to decrease hospital nebulisations
- Savings due to decrease in consultation costs
- Savings due to decrease specialist visits
- Savings due to increased productivity (less absenteeism)

Humanistic

- Improved quality of life
- Improved patient satisfaction
- Improved compliance
- Improved understanding of inhaler use
- Improved understanding of personal treatment plan
- Improved ability to use as peak flow meter
- Smoking cessation
- Avoidance of trigger factors
- Increase use of a spacer device when required

Challenges with measuring health outcomes

- Definition of health outcomes
- Careful planning of data collection
- Availability of good baseline information
- Selection bias
- Missing data points
- Validation of ICD10 and CPT codes
- Matching of control groups
- Regression to the mean
- Clinical and statistical differences
- Inter- and intra-scheme variability

Challenges

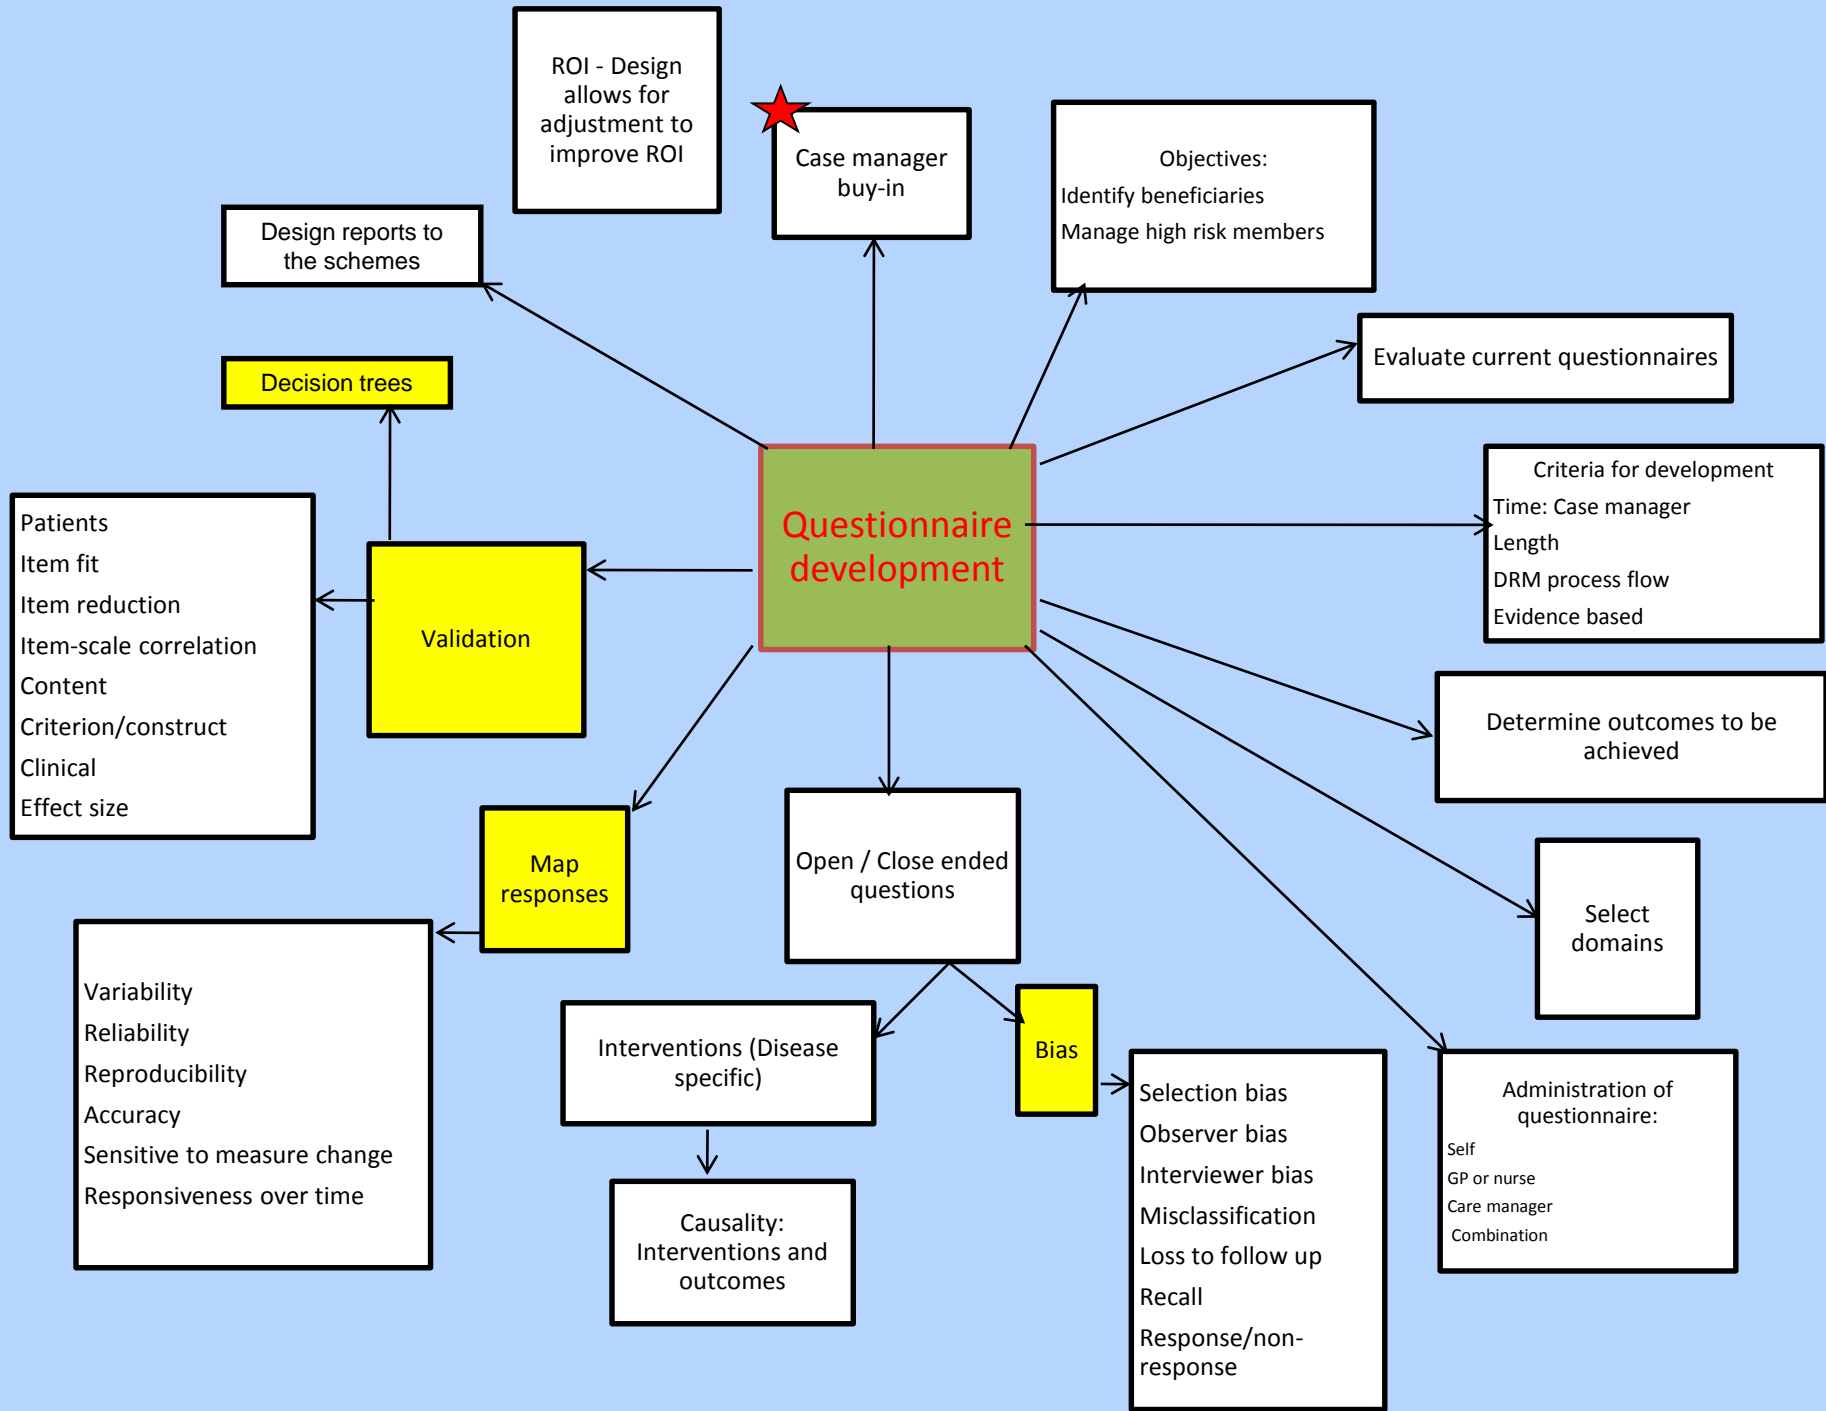

- A priori specification of confounding variables
- Interpretation – denominator effect, RTTM
- Development of questionnaires sensitive to changes over time
- Integration and automation of all systems
- Development of intelligent health systems
- Disease specific clinical measurement
- Not all information is extractable
- Develop impactability models

Project phases

- Phase 1: report on claims data
- Phase 2: report on clinical data
- Phase 3: development of measurement tools (questionnaires) for health outcomes reporting
- Phase 4: development of economic and probability models

Methods

- Pre –post intervention
- intervention vs control group

Questionnaire development

★ Case manager buy-in

Objectives:
Identify beneficiaries
Manage high risk members

Evaluate current questionnaires

Criteria for development
Time: Case manager
Length
DRM process flow
Evidence based

Determine outcomes to be achieved

Select domains

Administration of questionnaire:
Self
GP or nurse
Care manager
Combination

Bias
Selection bias
Observer bias
Interviewer bias
Misclassification
Loss to follow up
Recall
Response/non-response

Open / Close ended questions

Interventions (Disease specific)

Causality:
Interventions and outcomes

Map responses

Variability
Reliability
Reproducibility
Accuracy
Sensitive to measure change
Responsiveness over time

Validation

Patients
Item fit
Item reduction
Item-scale correlation
Content
Criterion/construct
Clinical
Effect size

Decision trees

ROI - Design allows for adjustment to improve ROI

Design reports to the schemes

Way forward

- Form industry group to develop methods
- Provide guidelines to industry to measure outcomes
- Implement a phased approach
